UI/UX DESIGN CASE STUDY

Sprout 2.0

A clearer first step into investing.

Designing a mobile-first homepage and onboarding journey that helps first-time investors prepare, understand each step, and know what happens next.

MOBILE-FIRST | TRUST & CLARITY | LIGHTWEIGHT UX

PREPARED BY

[Your Full Name] | [Your Roll No.]

Concept proposal based on the Sprout 2.0 assignment brief.

01 / PROBLEM FRAMING

The biggest conversion gap appears before KYC

Reported funnel numbers point to a substantial early-stage opportunity. The data is useful for prioritization, but the time windows and cohort definitions should be validated.

01

40,000

Downloads

Starting point

02

9,000

KYC completions

22.5% of downloads

03

3,000

First investments

33.3% of KYC; 7.5% of downloads

Signal 01 - Homepage bounce

78% bounce was measured over two weeks and includes a paid-ad campaign. Treat it as a noisy signal, not proof that the homepage alone is failing.

Signal 02 - KYC drop-off

62% drop-off is reported, but the cause is unknown. Support complaints about missing PAN/Aadhaar and a confusing wait screen are hypotheses to test.

DESIGN QUESTION

How might we help first-time investors start with enough clarity and confidence - while keeping risk information visible and the experience lightweight?

02 / DATA AUDIT

Use the numbers carefully, not literally

Separate what the brief reports from what the team can infer. Design decisions should be framed as hypotheses until they are tested with users who abandoned the journey.

REPORTED SIGNAL	WHAT IT CAN SUGGEST	CAVEAT / DESIGN RESPONSE
78% homepage bounce	A first-visit experience may not match expectations.	Paid ads are included. Segment by traffic source and intent before assigning causality.
62% KYC drop-off	The transition into identity verification deserves investigation.	Cause is unknown. Test document-readiness and wait-state hypotheses; interview drop-offs.
91% mobile users	Mobile should be the primary design target.	Use responsive layouts, readable type and large tap areas.
40% on phones under ₹10,000	The design must remain usable on constrained devices.	Avoid heavy media, excessive motion and complex page structures.
6.2 s average load on 4G	Perceived speed is part of the UX.	Keep assets small; use a lightweight vector mascot and avoid video/ticker.
"Many" prefer Hindi	Language flexibility matters.	No exact share is provided. Design for longer translated strings and validate demand.
65% say investing feels scary (n=40)	Users may need reassurance and plain-language guidance.	Existing users only; small sample excludes the people who dropped off.

Principle: the brief provides directional evidence, not a causal explanation or a validated persona.

03 / USER NEEDS

Design for two plausible needs - then validate them

These are proto-personas inferred from the brief and support feedback. They are not validated research personas, and should be replaced or refined after interviews with new and dropped-off users.

01 - The cautious first-timer

Need: understand what to prepare, why identity information is requested, and what investment risks mean. Friction hypothesis: unclear requirements make starting feel bigger and more uncertain than expected.

02 - The practical mobile user

Need: a quick, readable journey that works on a low-cost phone and a slower connection. Friction hypothesis: heavy pages, tiny controls or ambiguous loading states add avoidable effort.

JOURNEY MAP - FROM DISCOVERY TO FIRST NEXT STEP

01	02	03	04	05
Discover	**Prepare**	**Verify**	**Wait**	**Continue**
"Is this for me?"	*"What do I need?"*	*"Why are you asking?"*	*"Did it crash?"*	*"What now?"*
Calm hero + clear Rs 100 entry point	Sprout Ready checklist before KYC	Explain purpose beside PAN/Aadhaar fields	Visible review status; no invented ETA	Update/notification guidance and help path

Research next: interview users who abandoned KYC, not only existing customers, and test whether readiness and waiting-state clarity change behavior.

04 / DESIGN STRATEGY

Make trade-offs explicit

The design does not say yes to every request. It keeps what helps users understand the product and defers elements that add cost, distraction or performance risk.

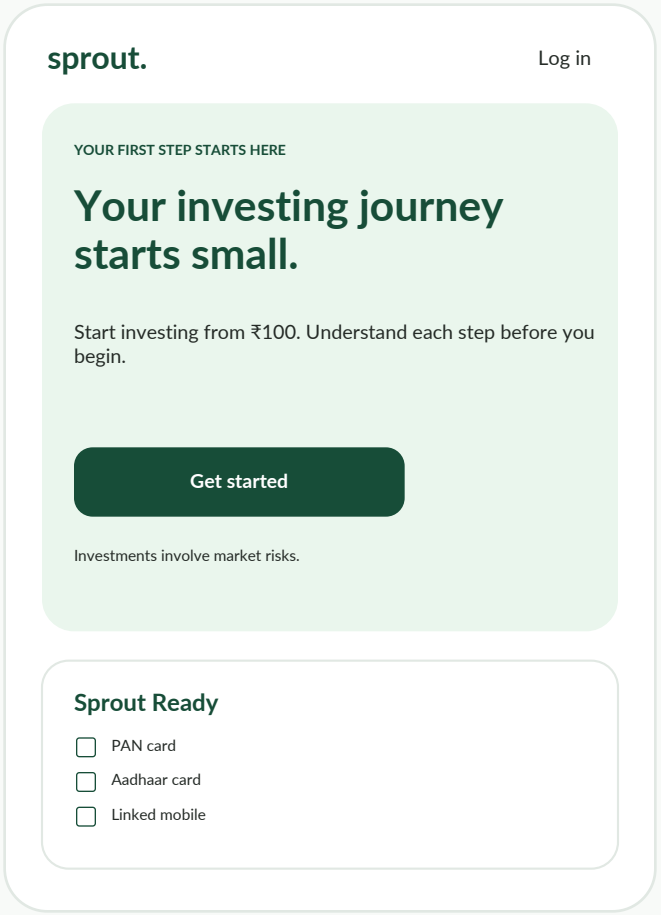

STAKEHOLDER	REQUEST / TENSION	DECISION & RATIONALE
CEO	Premium, minimal; no cartoon.	Use a restrained geometric sprout as a small guide - not a playful character dominating the page. It supports memorability without making the interface childish.
Marketing	Mascot, video, ticker, 3 pop-ups, referral banner.	Keep the mascot; defer video, live ticker and pop-ups. Move referral to after first investment. Reduce distraction and protect speed.
Compliance	Risk disclaimer 12 px+, visible without scrolling; banned terms.	Reserve a visible disclaimer strip on investment-content screens. Avoid “guaranteed”, “safe” and “risk-free”; never imply returns are assured.
Engineering	Under 1.5 MB page; animations under 100 KB; one developer / 3 weeks.	Use reusable components, a small vector mascot, limited states and one web-font family. Performance limits are targets to validate in implementation.
Support	Users unprepared for PAN/Aadhaar; wait screen feels crashed.	Introduce the readiness checklist before KYC, explain why details are requested, and use a clear waiting status with notification/help options.

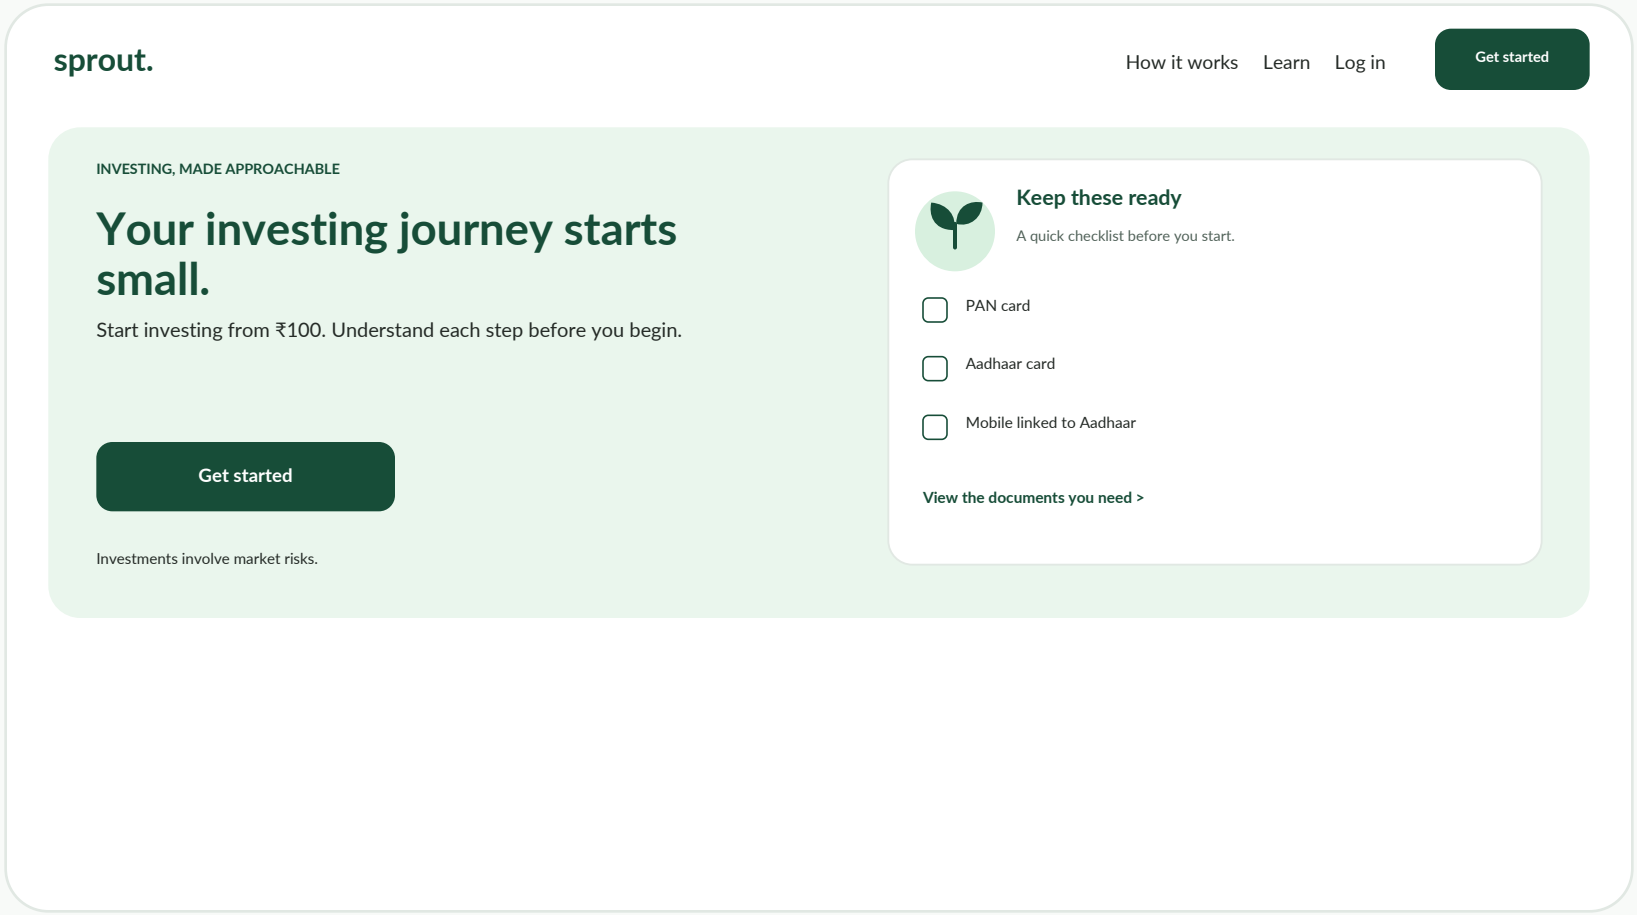

Trade-off summary: trust + readiness over promotional clutter; clarity + lightweight delivery over decorative complexity.

05 / HOMEPAGE CONCEPT

One story across mobile and desktop

Illustrative layout diagrams based on the design direction. They are concept previews, not exported screenshots of the final Figma frames.

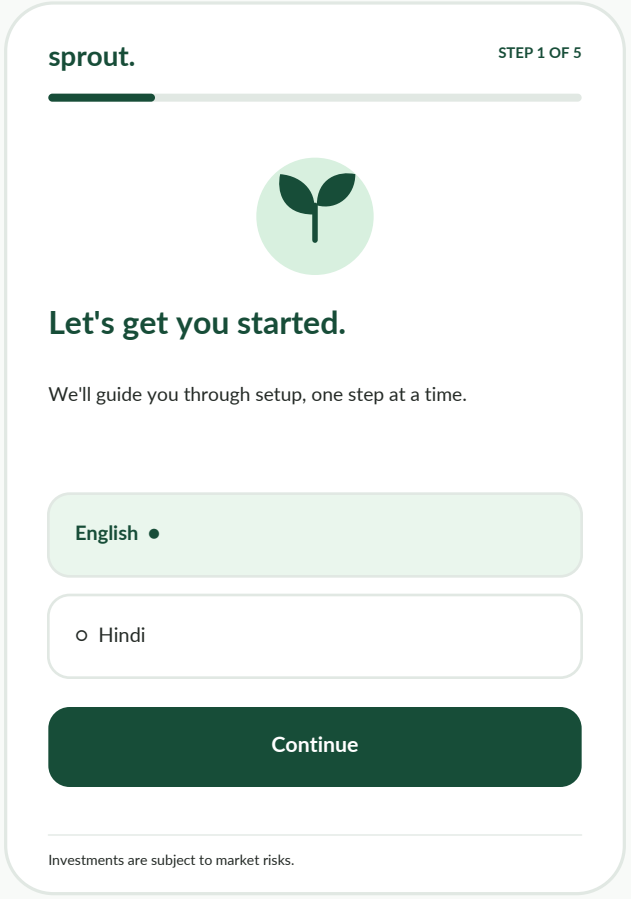

MOBILE: fewer, vertically stacked elements for small screens.

DESKTOP: balanced two-column hero; readiness card visible above the fold.

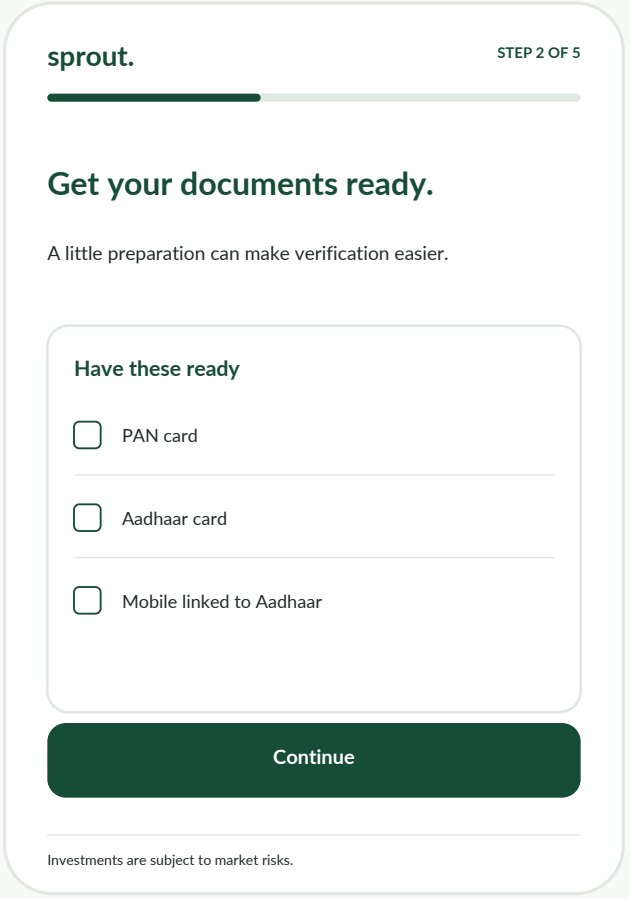

06 / ONBOARDING CONCEPT

Make the first two steps feel understandable

The first screen gives users a clear entry point and language choice. The second makes document requirements visible before the user is asked to submit them.

SCREEN 1 / WELCOME + LANGUAGE

SCREEN 2 / DOCUMENT READINESS

DESIGN RATIONALE

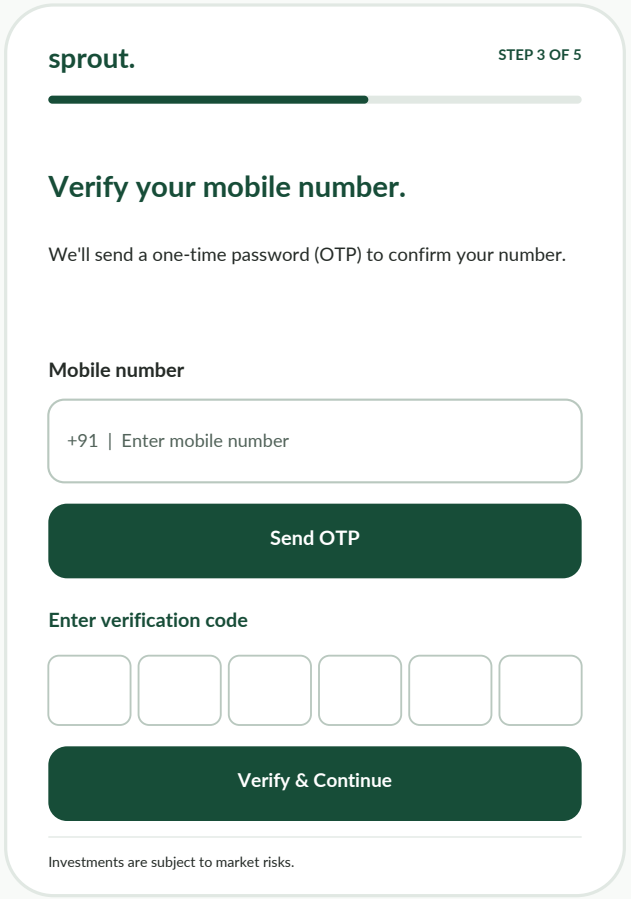

- English is the default; Hindi is presented without redesigning the layout.
- A visible progress marker communicates that onboarding has a bounded sequence.
- The checklist appears before identity fields to set expectations and reduce surprise.
- Use direct language and a single primary action per screen.
- Disclaimer remains visible on investment-content screens.

Prototype note: language selection is shown visually; a production build would need localization logic and translated content.

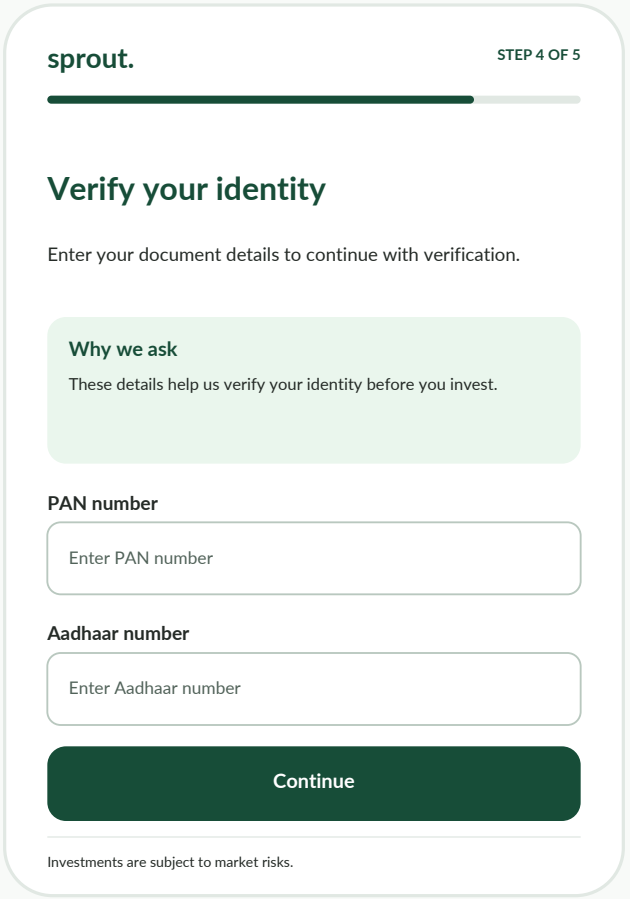

06 / ONBOARDING CONCEPT

Make verification feel like a guided process

Screen 3 combines the mobile number and OTP states in a compact design view; a production prototype should distinguish “Send OTP” from the state shown after a code has been requested.

SCREEN 3 / MOBILE + OTP

SCREEN 4 / PAN + AADHAAR

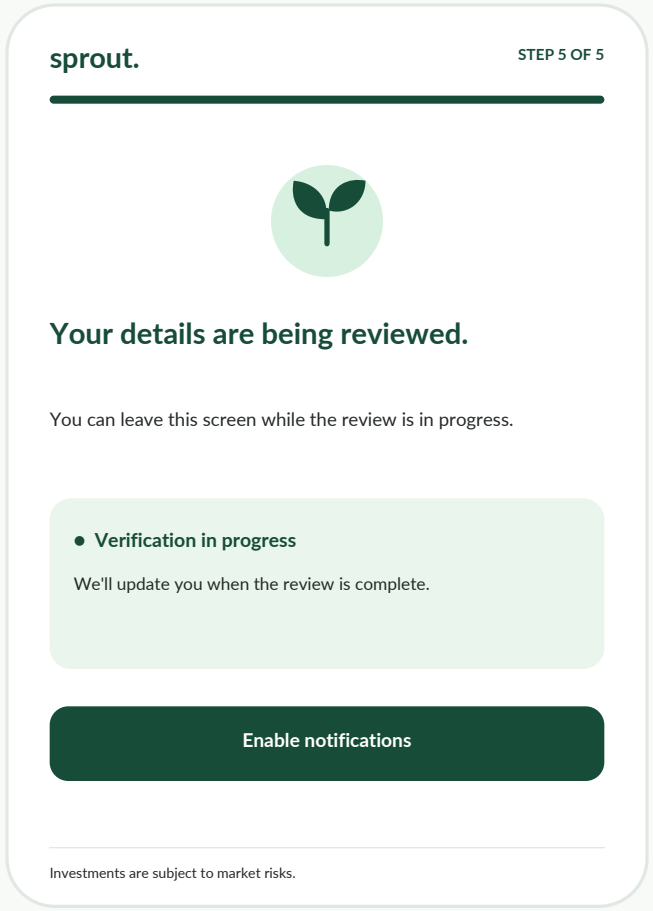

DESIGN RATIONALE

- Country code is explicit and placeholder text is visually lighter than field labels.
- Six OTP boxes communicate the expected code length and support a clear scan path.
- “Why we ask” explains the purpose of identity details next to the fields.
- Labels remain separate from placeholders to support scanning and accessibility.
- Use an actual secure, compliant flow for sensitive document details; this concept is not a functional data-collection implementation.

06 / ONBOARDING CONCEPT

A waiting screen should never look like a crash

The final screen gives a clear status, explains what happens next and offers a notification path. No completion estimate is shown because the brief provides no verified processing time.

WAIT-STATE PRINCIPLES

- Use a plain status label: “Verification in progress.”
- Explain that the review is underway and that users will be updated.
- Offer notifications and support instead of leaving an empty spinner.

END-TO-END FLOW

Prototype QA: test every CTA, back-navigation, OTP state transition and the waiting-screen message with realistic scenarios.

07 / DESIGN SYSTEM

A small system keeps the experience consistent

Colour, type and control patterns are reused across mobile, desktop and onboarding. Contrast ratios below are calculated from the listed hex colours; re-check in the final implementation.

COLOUR TOKENS

Forest
#174D38

Soft mint
#D8F0DF

White
#FFFFFF

Charcoal
#252B27

Muted
#52635A

Border
#E1E8E3

CONTRAST CHECKS

Forest on white	**9.74:1**
Charcoal on white	**14.45:1**
Forest on mint	**8.10:1**
Muted on white	**6.38:1**

TYPE SCALE

Hero 50 / Bold • Page heading 28-32 / Bold • Section 24 / Bold

Card heading 18 / Semibold • Body 16 / Regular

Helper 14 / Regular • Risk disclaimer 12 minimum / Regular

CONTROL PATTERNS

Primary button

Secondary

Enter mobile number

Implementation targets: body text >=16 px mobile; interactive targets >=44 x 44 px; disclaimer >=12 px above fold; page weight <1.5 MB; animation assets <100 KB.

08 / MEASUREMENT & NEXT STEPS

Measure clarity, completion and performance

These are proposed evaluation measures, not achieved results. Establish a baseline first, then compare with the redesigned experience using comparable traffic and user cohorts.

ACTIVATION

Download -> KYC start / completion

Track the full funnel by source and device.

COMPLETION

KYC completion rate

Compare the step-by-step drop-off, not just the aggregate 62%.

CONFIDENCE

Comprehension / readiness

Ask if users knew what documents were needed and why they were requested.

WAITING

Wait-screen exits and support contacts

Test whether status clarity reduces perceived-crash reports.

SPEED

Page weight and load performance

Measure real transferred assets and load performance on constrained 4G / low-end devices.

ACCESSIBILITY

Contrast, tap targets, Hindi expansion

Run design review and tests with translated strings and assistive technology.

PRIORITIZED VALIDATION

- Interview recent KYC abandoners about document readiness and unclear steps.
- Usability-test whether people understand the status message and next action.
- A/B test readiness checklist placement and wait-state copy; measure completion and support contact rate.

SUBMISSION CHECKLIST

Before submitting: replace author placeholders; verify Figma view access; test the prototype; export final Figma screenshots if this concept PDF differs from the final UI; confirm final page/asset weight with implementation.

Core idea: remove avoidable uncertainty before asking a first-time investor to take the next step.
